A food chain is an important part of the ecosystems around the world. A food chain helps describe which animals eat which plants and other animals. Everything eats something else and then those organisms are in turn eaten by something else. It's a chain that helps our world function. The food chain indicates how energy is transferred from one living organism to another.

Each ecosystem, or community of living things, has its own food chain depending on which plants and animals call that ecosystem home. Each plant, organism, or animal needs energy which is produced through the consumption of food to survive within their ecosystem. There are many food chains in any given ecosystem and when they are graphed out many overlap in what we call a food web. A food web shows the natural interconnection of which animals eat which plants and other animals and which ones eat similarly.
